Invasive forest weeds cause economic and environmental damage

Is ivy pulling down your trees? Are blackberries taking over your newly planted trees? Do you have stubborn holly in your understory? Are dreaded species like knotweed and Scotch broom popping up on your property? Invasive weeds not only inhibit the growth of or even kill your trees, they cause significant ecological harm by taking over ecosystems, crowding out native species, degrading wildlife habitat, and increasing erosion. Controlling these noxious invaders is a challenging but essential task for landowners.

At these field practicums, you will learn to identify and control some of the most common invasive weeds that cause economic and environmental damage in forests, including: holly, ivy, blackberries, knotweed, reed canary grass, butterfly bush, Scotch broom, and more. The practicum will cover both chemical (including organic-approved) and non-chemical control options.

Field-based, hands-on learning

These practicums are completely field based and centered around hands-on learning. After safety briefings, you will don protective gear (provided) to watch demonstrations and then do hands-on practicing of multiple control techniques, including hand-pulling, root digging, using a weed wrench, sheet mulching, foliar herbicides, cut stump treatments, and stem injection. You will learn about how to use both traditional and organic-approved herbicides safely and effectively, including what products to use for specific weeds and where to get those products, how to read a label, proper safety equipment, avoiding environmental damage, pesticide laws, tank mixing, calibrating a sprayer for the proper application rate, and clean-up.

INVASIVE FOREST WEED CONTROL FIELD PRACTICUM

Event Details

WHEN: Saturday, September 30, 2017
9 AM - 4 PM (gates open at 8 AM)

WHERE: New Tree Farm
1130 Stanwood Bryant Rd
Arlington, WA 98223
(1.5 miles east of I-5 Exit 212)
